A PRIVATE BRIEFING, EL PASO, NOVEMBER 2026

Six months of free decisions.

What to automate, what to buy, and what to leave alone before the new center opens.

Prepared for **Dr. Luis Ramos**, **Fernando Escarzaga**, and **Jesse Martinez**

Richard Finlay, RGF Global Ventures LLC

WHERE YOU ARE

The MRI is signed. No staff hired, no systems chosen.

Today

Every operational decision is cheap and reversible.

2027-01-01

Federal prior authorization APIs go live at the payers.

~2027-03

The build starts, so prior authorization is working before you open.

~2027-06

Target opening for your new center, April at the earliest. Whatever is in the vendor contracts by then is what you live with.

Greenfield is the entire argument. Nothing on the slides that follow is possible to do this cheaply after opening.

CMS-0057-F, 89 FR 8758, compliance dates verified in the Federal Register rule text.

THE FREE MOVE

Put four things in every vendor contract before you sign. They cost nothing today.

- **API access** to your own data, named in the contract, not "available on request."
- **HL7 interface count and fee schedule** fixed at signature, not quoted per interface later.
- **Data export rights** in standard formats, on demand, at no charge.
- **DICOM query permissions** (worklist, query/retrieve, DICOMweb) for systems you authorize.

Before signature these are contract terms. After signature they are hostage terms.

THE HEADLINE NUMBER

11.5%

of denied prior authorizations were appealed

80.7%

of those appeals were partially or fully overturned

Four in five appeals win. Almost nobody files one.

Source: KFF, "Medicare Advantage Insurers Made Nearly 53 Million Prior Authorization Determinations in 2024," 2026-01-28, analyzing data insurers report to CMS. Medicare Advantage, all services; CMS does not report prior authorization data by service type.

WHY GREENFIELD MATTERS

40%

of physicians report having staff who work **exclusively** on prior authorization.

You have not hired that person yet.

Source: American Medical Association, 2025 AMA Prior Authorization Physician Survey, 1,000 practicing physicians (400 primary care, 600 specialists). Self-reported survey data.

BEFORE THE NUMBERS: WHAT AN AI AGENT IS

Software that does a job inside your systems, and asks a person before anything leaves the building.

One that runs a workflow

An operations agent works one process from start to finish: a prior authorization, a cancelled slot filled from the waitlist, a records request. It works through your RIS and the payers' own electronic connections, not by clicking around a screen. Someone on your staff approves anything that goes out.

One you talk to

An owner's agent you text or call. Ask how many MRIs were read last week, or which referrer went quiet, and it answers from your own numbers. Every Monday it sends a short report: volumes by modality, reader, and referrer; authorization and denial rates; reconciliation.

The guardrails

- **A person signs** anything clinical and anything that leaves the building.
- **Numbers are calculated and checked**, never guessed. If a figure cannot be verified, it says so.
- **HIPAA business associate agreements** with every vendor that touches patient data.
- **Patient data stays in the United States.**

PART ONE

The thing you did not ask about.

Prior authorization and eligibility verification. Scheduling, phones, and records are real costs. This one is larger, and it is the one with the best evidence.

WHAT IT COSTS IN TIME

13

hours per physician per week spent on prior authorization

40

prior authorization requests per physician per week

Of physicians who do not appeal denials, 59% say they do not expect to win and 52% cite insufficient staff time.

CMS used the same hours figure to price this burden at **220 million provider hours** over ten years, in the prior authorization rule itself.

Sources: American Medical Association, 2025 AMA Prior Authorization Physician Survey. Self-reported. CMS-0057-F, 89 FR 8758, 2024-02-08, Regulatory Impact Analysis; a regulatory projection, not measured savings.

THE DATES LAND ON YOUR OPENING

2026-01-01

Payers must decide prior authorizations in **7 calendar days** standard, **72 hours** expedited, and publish their metrics.

2027-01-01

Payers must operate a **FHIR Prior Authorization API**, plus Patient Access, Provider Access, and Payer-to-Payer APIs.

Target ~2027-06

Your new center opens into the new regime, with prior authorization already working and no legacy process to unwind.

Who the rule reaches: Medicare Advantage, Medicaid, CHIP and exchange plans. Not employer-sponsored plans, TRICARE, or VA. The payers who move first set the standard the rest follow.

Almost 63% of medical plans report they are already building a FHIR prior authorization API ahead of the deadline.

Sources: CMS-0057-F, 89 FR 8758, compliance dates verified in rule text; covers Medicare Advantage, Medicaid and CHIP, and federally facilitated exchange plans. 63% figure: 2025 CAQH Index (DataSpring), 2026-02-19, payer self-report.

WHAT A PRIOR AUTH PROCESS ACTUALLY DOES ALL DAY

4.94%

of 17,913 outpatient MRI prior authorization requests were denied at one institution over four years. The other 95% were approved.

A process that approves 95% of what it touches is one you automate, not one you staff.

Source: Harrer S et al., J Am Acad Orthop Surg, 2025 Feb 15;33(4):e244-e252, PMID 39729599. Single institution, 2019 through 2022. The authors' own conclusion: the low denial rate "underscores the questionable utility of the prior authorization process."

ONE ORDER THROUGH PRIOR AUTHORIZATION

An MRI order arrives at 9:00 on a Tuesday. Here is what the agent does with it.

1. The order comes in from the referring office and lands in your RIS.
2. The agent checks the patient's coverage and whether this payer requires authorization for this study.
3. If it does, the agent assembles the request from the order and the clinical notes, and checks it against that payer's rules.
4. Your staff member reviews it and approves. Only then does it go to the payer, over the payer's electronic connection.
5. The agent watches the payer's decision clock and puts the approval on the schedule the moment it arrives.
6. If it is denied, the agent drafts the appeal with the reasons and puts it in front of a person. Nothing goes out unsigned.

You will click through this yourself: a working prior authorization demo on synthetic data, no real patients, already built. The real one is wired to your RIS and payers in Phase 4.
rfinlay.github.io/imaging-priorauth-demo

PART TWO

The three things you did ask about, corrected.

Scheduling. Answering patients. Requesting records. All three are real. Two of them are not what they look like.

SCHEDULING: THE EMPTY SLOT IS NOT A NO-SHOW

22.3%

of outpatient radiology exams were cancelled

2.0%

were no-shows

70.2% of cancellations were patient-initiated, which means most empty slots are known in advance. That is a backfill problem, not a reminder problem.

Source: Aijaz A et al., "Sociodemographic Factors Associated with Outpatient Radiology No-shows Versus Cancellations," Acad Radiol, 2024 Aug;31(8):3406-3414, PMID 38705764. University of California, Irvine. 19,262 exams, 9,713 patients. Single center.

SCHEDULING: WHAT REMINDERS HONESTLY DO

5.1%

MRI no-show rate with phone reminders alone

3.8%

after adding a text message reminder

A real effect, 1.3 percentage points, in a randomized trial of 6,989 MRI patients. It did not improve arrival punctuality. **Your RIS will do this. Let it.**

Source: Liu C et al., "Text Message Reminders Reduce Outpatient Radiology No-Shows But Do Not Improve Arrival Punctuality," J Am Coll Radiol, 2017 Aug;14(8):1049-1054, PMID 28583321. Massachusetts General Hospital. p = 0.02; only 67.5% of the texting arm could be reached by text.

ANSWERING PATIENTS: BUY IT, DO NOT BUILD IT

26.5%

of El Paso County residents aged 5 and over speak English less than "very well." 97.8% of them speak Spanish.

My recommendation: buy a healthcare voice vendor. I will write the specification, run the evaluation, and integrate and supervise it. Voice is the highest-blast-radius failure in this whole list, and it is a funded category I cannot beat on cost.

Source: American Community Survey 2024 5-year, Table B16004, El Paso County, population 5 and over of 813,194; 215,186 speak English less than "very well." Computed from raw ACS counts via Census Reporter.

The 30-day clock runs from receipt

Not from when the request reaches the right desk. One extension of up to 30 more days, with written notice inside the first 30. Outer limit 60 days.

Finding the study is unbillable

Fees may cover labor to copy, supplies, postage, and an agreed summary. Search and retrieval labor is explicitly not chargeable. The expensive half of the work cannot be charged for.

The harder problem is outbound. A new center opens with zero priors on file. Every comparison study comes from somewhere else, and RSNA is on record that DICOM exchange is not yet a TEFCA requirement.

Sources: 45 CFR 164.524 (right of access, deadlines, permitted fee components); Ciox Health v. Azar, 435 F. Supp. 3d 30 (D.D.C. 2020), which left the $6.50 flat-fee option in place; RSNA comment letter to ASTP/ONC, March 2026. OCR's Right of Access Initiative has produced more than 50 enforcement actions.

THE FIFTH CANDIDATE: THE NUMBERS THE OWNER ACTUALLY LOOKS AT

Studies by modality, by reader, by referrer. Turnaround. Scheduled versus completed. Revenue per slot.

All of it already lives in the RIS and the billing system. The problem is that they are two systems, and RIS reporting is built for radiology operations, not for an owner.

As an owner, I want to ask one question on a Monday morning, which referrer went quiet, what is the appeal rate, are we being paid for what we read, and get the answer from my own numbers, **so that** I run the center on facts and not on a report someone has to build for me. The manager and the front desk lead see the same numbers from their side: today's schedule, the open authorizations, the slots that just opened. Smallest compliance envelope of the five. Cheapest to build.

THE SCORECARD

CANDIDATE	MY RECOMMENDATION	WHY
Prior authorization and eligibility	**Build**	Strongest evidence, vendors built for someone much larger, federal APIs arrive 2027-01-01.
Scheduling: reminders and self-scheduling	**Buy (the RIS)**	Commodity. Bundled in modern imaging RIS products.
Scheduling: cancellation backfill	**Build, small**	Ranked waitlist on top of the RIS. Addresses the 22.3%, not the 2.0%.
Answering patients (voice)	**Buy, I integrate**	Funded category, highest blast radius, Spanish bar is unforgiving.
Records: inbound requests, outbound priors	**Build, selectively**	Hard deadlines, unbillable retrieval labor, unsolved outbound gap.
Owner reporting	**Build**	Custom by nature. Smallest compliance footprint.
Billing, claims, and the eligibility feed	**Buy**	Commodity clearinghouse function. I evaluate reachability and contract terms, not the claims work. Row 1 reads the feed; it does not replace the vendor.

PART THREE

LIVE DEMO

Proof: RadAssist, live.

Structured radiology reporting, in production and in daily use by the radiologist sitting at this table. His template, his rules, his signature. It drafts; he signs. Nothing you type leaves the browser.

Calcium scoring

Reads the scanner's numbers from a pasted screen capture. He confirms every value before it applies.

Thyroid ultrasound

ACR TI-RADS, with his follow-up rules built in.

Spine MRI, new

Cervical, thoracic, and lumbar. Built from Dr. Ramos's own template and rules. Every rule in it is his.

CT Spine, live Nov 2

The same tool, switched to CT: bony canal, calcification, the CT disc findings. Built from his sample reports two days after the MRI module.

Next, at his request: voice dictation, brain, cardiac CTA (CAD-RADS). Reading the images themselves is a future item with a regulatory path, not a promise.

radassist.app · Spine MRI, lumbar, one synthetic case, about three minutes.

RADIOLOGY REPORT ASSISTANCE

The agent drafts. The radiologist signs. Nothing clinical leaves without a human signature.

The report: RadAssist, today

Luis uses it daily. Calcium scoring reads the scanner's numbers from a screen capture; thyroid, spine MRI, and CT spine build the report from his own template, one dropdown per sentence, with his rules for the impression. He confirms every value before it applies and signs. At your center the path has a name: DICOM worklist and query for the study, HL7 v2 ORU to carry the signed report into the RIS.

The records: a different build

Requesting records runs the other way: DICOM query and retrieve where a facility grants it, a request out and DICOM import where it does not, and the payer Provider Access API in 2027 for the claims record, in-network only, no images.

Which did you mean?

Two different builds, specified separately. I would rather ask than guess.

One stack, or one per center? Both work.

One specification, reused for every center. Same owners across the centers: one shared stack, each center's data segregated, every session scoped to one center. Different owners per center: a separate instance each, with its own database, credentials, and audit log. Either way, no patient record from one center is readable from another.

> Software intended "for administrative support of a health care facility, including the processing and maintenance of financial records, claims or billing information, appointment schedules, business analytics, information about patient populations, admissions, practice and inventory management, ... determination of health benefit eligibility, population health management, and laboratory workflow" is not a medical device.

Every candidate on the scorecard is on that list by name. The agents stop at the clinical boundary: nothing interprets an image, selects a protocol, or recommends a study.

Source: 21 U.S.C. 360j(o)(1)(A), read verbatim at Cornell Legal Information Institute. 360j(o)(2) further provides that FDA "shall not regulate" excluded administrative functions even when they coexist with device functions.

Texas SB 1188

Electronic health records with Texas patient data must be physically stored in the United States as of 2026-01-01. Every component, including the model provider, gets verified for US residency before anything is promised.

TCPA, wireless healthcare exemption

One message per day, three per week, per patient. No billing or financial content. Provider name and opt-out in every message. $500 per violation, up to $1,500 if willful.

The AI vendor's BAA

Anthropic's agreement now covers Skills, Web Search, Memory, and the Bash and Text Editor tools. It still excludes Computer Use and Web Fetch, which are exactly what you would reach for to drive a payer portal with no API. So the prior auth design routes through APIs, EDI, or a human step. Not screen-driving.

Texas HB 300

Its definition of covered entity is broad enough to reach me directly, not only through your BAA. I carry that obligation in my own right.

Sources: Texas SB 1188 (89R), signed 2025-06-20, effective 2025-09-01, bill history at capitol.texas.gov; 47 CFR 64.1200(a)(9)(iv) and 47 U.S.C. 227; Anthropic BAA documentation at privacy.claude.com, accessed 2026-10-01; Texas Health and Safety Code Chapter 181.

THE QUESTION YOU ARE GOING TO ASK

What happens when I get hit by a bus?

- **You own the specification.** It is written for a competent engineer who has never met me, and it is the deliverable of the design engagement whether or not I build anything.
- **You own the code.** Everything specific to this center lives in a repository under your organization's account, with my access revocable by you. Existing product of mine that I extend for you stays licensed to the center, on terms we put in writing, so you are never hostage to me.
- **Runbooks, not memory.** Every operational procedure is written down: how it runs, how it fails, who to call at each vendor.
- **No proprietary runtime.** Standard interfaces (HL7 v2, DICOM, payer APIs) and a named model vendor under its own BAA. Any integrator can take it over.
- **Buy where buying is right.** The voice vendor and the RIS are yours directly. Nothing routes through me that does not have to.

THE MOST IMPORTANT SLIDE

What I recommend you do not buy from me.

- **A custom voice agent.** Buy a vendor. I will specify, evaluate, and integrate it, and I will tell you when it is not good enough in Spanish.
- **Reminders, self-scheduling, and intake forms.** Your RIS does this. Make sure the contract says so, then use it.
- **Anything built to resell to other centers.** This center is the reference implementation and the priority. If I ever take on a second site, your service terms do not change, in writing.
- **Anything that touches the image clinically.** Not from me, not from anyone, without an FDA pathway.

IF IT WERE MY MONEY

I would do three things before signing another vendor contract.

- Put the four access terms into every contract this month. It is free.
- Decide now whether the prior authorization desk is a hire or a system. That decision expires the day you hire for it.
- Tell me what front desk and prior authorization actually cost you last time. Your number beats any benchmark I could bring.

And one question for you: what would you do differently this time, knowing how the last one ended up?

WHAT THE DATES DEPEND ON

The build starts in March so everything works before you open. These have to be true first.

- **A signed agreement.**
- **Your vendors selected and contracted** (Phase 2), with sandbox access to their interfaces: API, HL7, and DICOM.
- **Test access to the payers' connections** for prior authorization, FHIR and EDI.
- **HIPAA business associate agreements signed.**
- **One named person on your side** who approves.
- **Your expected volumes and payer mix**, before payer-specific design starts.
- **Equipment delivery dates**, so the build lands on the install.

If one of these slips, the dates move with it, and the price does not. You hear about it the day it happens.

THANK YOU

Every one of these decisions is reversible today. None of them will be in six months.
